Project abstract:

This observational study seeks to investigate the size differences in female members of the Adelie Penguin (Pygoscelis adéliae) species within the islands of the Palmer Archipelago. Specifically, this study aims to analyze the difference in flipper length (mm), and body mass (g) between the female members of the Adelie species within the islands of the Palmer Archipelago: Biscoe, Dream and Torgerson.

Mini-Project_DMP

Data Collection

What types of data will you collect, create, link to, acquire and/or record?

The data will be acquired from *structural size measurements and isotopic signatures of foraging among adult male and female Adélie penguins (Pygoscelis adeliae) nesting along the Palmer Archipelago near Palmer Station* by the Palmer Station Antarctica LTER in 2020, and can be accessedhere. The data analyzed will include two numeric variables: flipper length (mm) and body mass (g). These data from these variables will then be compared across the three islands: Biscoe, Dream, and Torgersen.

What file formats will your data be collected in? Will these formats allow for data re-use, sharing and long-term access to the data?

The data files will be stored as CSV files to ensure replicability and access without proprietary software. These files will be available in a GitHub repository accessible here.

What conventions and procedures will you use to structure, name and version-control your files to help you and others better understand how your data are organized?

I will be using data dictionaries and README files to ensure that the data is comprehensible. I will also be using GitHub to version control the data and code.

Documentation and Metadata

What documentation will be needed for the data to be read and interpreted correctly in the future?

Question not answered.

How will you make sure that documentation is created or captured consistently throughout your project?

Question not answered.

If you are using a metadata standard and/or tools to document and describe your data, please list here.

Question not answered.

Storage and Backup

What are the anticipated storage requirements for your project, in terms of storage space (in megabytes, gigabytes, terabytes, etc.) and the length of time you will be storing it?

The required storage space for this project should be extremely small, likely within 10 megabytes. I will be storing this project through OSF and GitHub and will therefore be keeping access to the files for the foreseeable future.

How and where will your data be stored and backed up during your research project?

Due to the limited file size of this project, it will be stored locally and backed up through an open science framework project and a GitHub repository.

How will the research team and other collaborators access, modify, and contribute data throughout the project?

There are no other collaborators.

Preservation

Where will you deposit your data for long-term preservation and access at the end of your research project?

Question not answered.

Indicate how you will ensure your data is preservation ready. Consider preservation-friendly file formats, ensuring file integrity, anonymization and de-identification, inclusion of supporting documentation.

Question not answered.

Sharing and Reuse

What data will you be sharing and in what form? (e.g. raw, processed, analyzed, final).

In this study, raw, processed and analyzed data will all be made available and accessible as CSV files through the OSF project here.

Have you considered what type of end-user license to include with your data?

The licensing chosen for this project is CC by 4.0.

What steps will be taken to help the research community know that your data exists?

As mentioned, the data for this project will be deposited through OSF and all code will be available through the GitHub repository. Both the OSF project and GitHub repository will be linked in the data/code availability sections of the final draft of the study.

Responsibilities and Resources

Identify who will be responsible for managing this project's data during and after the project and the major data management tasks for which they will be responsible.

Question not answered.

How will responsibilities for managing data activities be handled if substantive changes happen in the personnel overseeing the project's data, including a change of Principal Investigator?

Question not answered.

What resources will you require to implement your data management plan? What do you estimate the overall cost for data management to be?

Question not answered.

Ethics and Legal Compliance

If your research project includes sensitive data, how will you ensure that it is securely managed and accessible only to approved members of the project?

Question not answered.

If applicable, what strategies will you undertake to address secondary uses of sensitive data?

Question not answered.

How will you manage legal, ethical, and intellectual property issues?

Question not answered.
