A Data Management Plan created using DMP Assistant

Creator: Dylan George

Principal Investigator: Dylan George

Data Manager: Dylan George

Project Administrator: Dylan George

Affiliation: Other Organisation

Funder: Digital Research Alliance of Canada

Template: Alliance Template

ORCID iD: 0009-0005-2987-8890

Project abstract:

This observational study seeks to investigate the size differences in female members of the Adelie Penguin (*Pygoscelis adeliae*) species within the islands of the Palmer Archipelago. Specifically, this study aims to analyze the difference in flipper length (mm), and body mass (g) between the female members of the Adelie species within the islands of the Palmer Archipelago: Biscoe, Dream and Torgerson. The OSF project associated with this DMP can be accessed [here](#).

Mini-Project_DMP

Data Collection

What types of data will you collect, create, link to, acquire and/or record?

The data will be acquired from *structural size measurements and isotopic signatures of foraging among adult male and female Adélie penguins (Pygoscelis adeliae) nesting along the Palmer Archipelago near Palmer Station* by the Palmer Station Antarctica LTER in 2020, and can be accessed [here](#). The data analyzed will include two numeric variables: flipper length (mm) and body mass (g). These data from these variables will then be compared across the three islands: Biscoe, Dream, and Torgersen.

What file formats will your data be collected in? Will these formats allow for data re-use, sharing and long-term access to the data?

The data files will be stored as CSV files to ensure replicability and access without proprietary software. These files will be available in the OSF project linked to this DMP in the project abstract above.

What conventions and procedures will you use to structure, name and version-control your files to help you and others better understand how your data are organized?

I will also be using GitHub to version control the code and OSF for all data management.

Documentation and Metadata

What documentation will be needed for the data to be read and interpreted correctly in the future?

I will be using data dictionaries and README files to ensure that the data is comprehensible for reproducibility.

How will you make sure that documentation is created or captured consistently throughout your project?

All documentation will be managed through an OSF project and GitHub repository. Specifically, OSF will contain an archive of all relevant files and a comprehensive wiki linking the important files.

If you are using a metadata standard and/or tools to document and describe your data, please list here.

The data will be stored as CSV files and will be machine readable. RStudio will be used to analyze and process the data.

Storage and Backup

What are the anticipated storage requirements for your project, in terms of storage space (in megabytes, gigabytes, terabytes, etc.) and the length of time you will be storing it?

The required storage space for this project should be extremely small, likely within 10 megabytes. I will be storing this project through OSF and GitHub and will therefore be keeping access to the files for the foreseeable future.

How and where will your data be stored and backed up during your research project?

The data will be stored in an OSF archive part of the overarching project linked in the project abstract.

How will the research team and other collaborators access, modify, and contribute data throughout the project?

There are no other collaborators.

Preservation

Where will you deposit your data for long-term preservation and access at the end of your research project?

The data will continue to be archived in the OSF archive linked in the project abstract above.

Indicate how you will ensure your data is preservation ready. Consider preservation-friendly file formats, ensuring file integrity, anonymization and de-identification, inclusion of supporting documentation.

The files will be saved as comma-separated values (CSV) and all documents will be saved as PDF files. The files names will also be machine readable.

Sharing and Reuse

What data will you be sharing and in what form? (e.g. raw, processed, analyzed, final).

In this study, raw, processed and analyzed data will all be made available and accessible as CSV files through the OSF project linked in the project abstract above.

Have you considered what type of end-user license to include with your data?

The licensing chosen for this project is [CC by 4.0](#) and the GitHub repository will be licensed through MIT License.

What steps will be taken to help the research community know that your data exists?

As mentioned, the data for this project will be deposited through OSF and all code will be available through the GitHub repository. Both the OSF project and GitHub repository will be linked in the data/code availability sections of the final draft of the study.

Responsibilities and Resources

Identify who will be responsible for managing this project's data during and after the project and the major data management tasks for which they will be responsible.

The primary author will be managing all of the data. For any inquiries regarding the data/code, the primary author may be contacted.

How will responsibilities for managing data activities be handled if substantive changes happen in the personnel overseeing the project's data, including a change of Principal Investigator?

The data will remain in an OSF project regardless of any substantive changes.

What resources will you require to implement your data management plan? What do you estimate the overall cost for data management to be?

N/A

Ethics and Legal Compliance

If your research project includes sensitive data, how will you ensure that it is securely managed and accessible only to approved members of the project?

The data in this study is not sensitive.

If applicable, what strategies will you undertake to address secondary uses of sensitive data?

The data in this study is not sensitive.

How will you manage legal, ethical, and intellectual property issues?

The data used in this study will be licensed under [CC by 4.0](#), so there should be no issues regarding incorrect usage.
